■Block Diagram

■Standard External Circuit

- C1: Oscillation prevention capacitor (approx. 0.33 μ F)
Connection to terminal No.2 must be made as short as possible.
- C2: Output capacitor (47 to 100 μ F)
Connection to terminal No.1 must be made as short as possible.
- D1: Protection diode (RM1Z)
Required for protection against reverse biasing of input and output.

Note 1: Connect a 47 μ F to 100 μ F capacitor to both sides of the load if the wiring between the output terminal and the load is long.

Note 2: An isolation type diode is provided from input to ground and also from output to ground. These may be destroyed if the device is reverse biased. In this case, use a diode with low V_F to protect them.

Note 3: The output voltage may not be adjusted by raising the ground voltage (using a diode or resistor).
